FIG. 1

FIG. 2

force applied to the ratchet
is not the rotation direction. The twisting force is
small, and thus the efficiency is low.

FIG. 3

Drawings for Discussion the Novelty of the Present Invention.

2a

$\begin{matrix} \nearrow N9'' \\ \rightarrow N9 \\ \searrow N9' \end{matrix} = \rightarrow N9 + N9' + N9''$
 Part of the forces of $N9'$
 are counteracted from
 each other

2b

No force normal to
the wall of the ratchet

2c

Drawing for Discussion 1 in the Response

The groove has an opening facing toward the ratchet, and part of the direction control unit protrudes from the groove.
